Cup Lock System

The Cuplock system is a complete system that provides access scaffolding and formwork slab support.
This formwork slab support can be used in a wide variety of applications from light to heavy duty scaffolding and shoring for buildings and other civil engineering work. In addition, no loose fittings are required. A hammer is the only tool required for erection and dismantling of the system.
Several accessories ensure the adaptability of the system to a wide variety of applications.
The standard is the vertical member of cup lock system. It is made from high grade steel tube with outer diameter of 48.3 mm and thickness of 3.2 mm.
A series of bottom cups are welded at nominal 500 mm centers and free top cup to ensure providing a safe connection at any direction for the horizontal ledger attachment.
Cup-lock vertical standards vary from 0.5 m to 3.0 m.
The ledger is the horizontal member used to connect the standards in both the longitudinal and transversal directions. It is made of the same vertical tube. They are welded together to blade the ends and fit in the bottom cup located in the standard. Ledger sizes vary from 0.6 m to 2.4 m.

Alu Deck System

Aludeck is a slab system that covers the most important slab form methods just in one system.
This means using the same parts in the different applications, also mixing the different Aludeck methods-MIP and PMD- depending on the requirements of the floor plan.
The availability of choosing between separate plywood (MIP method) or panels with implemented plastic –long life- plywood (PMD method).
The reduction of the labor cost due to the few intensive adjustments on the jobsite.
The simplicity of the system reduces the mistakes in handling and makes the workers safer.
The beams and panels are all made of Aluminum and are powder coated.

Ring Lock System ARK

Acrow all round kit (ARK) is one of the most popular and widely used systems in newly constructed projects.
It can be used to act as a shoring system for slabs and for facades for external plaster. In addition, the disappearance of the modular plain brace together with the no need for tubes or couplers in the diagonals is what makes the system easier and faster. Moreover, hot dip galvanization extends the service life of the ARK system components.
The system components are light and could be man handled easily. The ARK system also conforms to the latest occupational safety standards to provide the clients with applicable and cost effective solutions for the whole requirements.
It is composed of a perforated steel disc with 4 small openings for ledger positions and 4 wide openings for aligning the ledgers and the diagonal braces at angles.
The vertical ring standard has different lengths, from 0.5 m to 3.0 m with 0.5 m increments.
The ledger is the horizontal member used to connect the standards in both the longitudinal and transversal directions. Ledger sizes vary from 0.6 m to 2.4 m.

Acrow Bridge Table Form

Acrow bridge table is one of the best solutions for any box girder bridge.
Bridge deck system h20 & solider consist of panels connected together. It is assembled in ground level and lifted as a one unit to its location.The shoring is either Acrow shorbrace system with high load capacity or ring system with its modular components.
Shoring also can be moved as one unit horizontally by wheel jack units or vertically by crane.

Scaffolding System

The main scope of work for Acrow in San Stefano complex was supplying scaffolding to cover all facades for finishing works.
San Stefano complex is built on area of 30000 m2.

Grandstand System

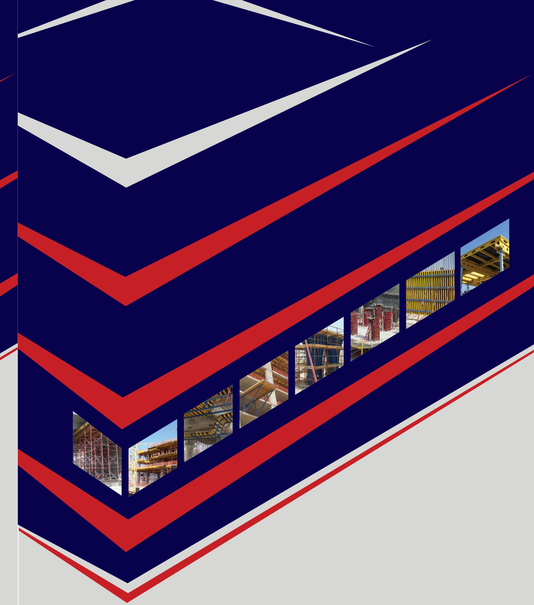

Acrow Scaffoldings can be also used for temporary status and grandstand.
The above project is Opera Aida were a unique scaffoldings in Egypt were used in it.

ACROW Formwork Technology

ACROW MISR Provides full site service Based on more than 35 Years Experience in the field

H20 & Soldier System

Acrow H20 and soldier system is one of the most flexible systems in Acrow formwork. In addition, it is a multipurpose system, where it can be used in different applications.
The H20 and soldier wall system formwork elements are easily and quickly assembled by connecting the H20 timber beams to the soldier by the means of H20 connection.
Moreover, elements dismantling are done as easily as system erection.
The main H20 and Soldier system advantage is that it provides both high adaptation and easy re-assembling when structure ground plans are changed frequently.
In addition, this system proved to be one of the most economical alternatives compared with steel frame formwork panel system, where it comes to both complicated designs and numerous non-typical applications with the same wall heights.
The H20 and Soldier system is typically used for all types of walls and columns where it showed to have high rigidity as well as high stability compared with the panels' low weight.

Tech Form System

The Acrow Tech - Form Panel System with Its Highly Engineered steel profile is specially designed to suit a variety of applications of concrete walls & columns adapting it to any structure.
The panels are manufactured & designed to be more durable, economical with high load capacity & flexibility that provides high cost efficiency & fast workflow. While the superb quality powder coating finish provides the system with a unique level of protection hence longer life span.

Eco Form System

The ECO Form light weight panel system is an innovative system where a range of panels and accessories are responsible for quick and economical framing of any vertical concrete shape in the buildings.
Moreover, Due to the lightness and high materials quality of the ECO form system, it allows for either manual or crane handling which enables for extraordinary performance.
In order to reach the optimum balance between both the lightness and the strength, new materials and technical innovations were introduced and combined together resulting for this ideal balance.
The new materials used in this system were as follows:
1. High engineered light weight steel profile which provides a more durable and economical system.
2. Plywood covered by phenolic film and standard accessories such as clamps in order to make gangs by joining panels.
Eco form is the best solution for foundations, cellar tanks, low retaining walls, parapets and small areas. This perfection returns mainly to the sturdy elements which are actually light in weight and handy to enable Eco form to be on the top solutions to be used on these applications. Moreover, what makes it easier for being used in high walls is the flexibility of the panels to be stacked upright or sideways to fit the intended purpose smoothly.

Vari Form System

Vari form is a panel wall system used for curved and rounded walls.
It is very easy to be adjusted turn buckles which allows a curve with minimum diameter 3.00 m.
Only two levels of turn buckles are used for 3.60 m wall height.

Acrow Crane Climbing System

Due to Acrow long experience in major projects and the market demand in the last 20 years we developed crane climbing system to be
ACB 240 system which is especially designed to meet our client's expectations:
Quality - Safety - Price
Speed of implementation
ACB 240 features and benefits:
- Easy to erect
- Formwork panel & access bracket can be lifted as one unit so accelerate the work and reduce labor and crane cost.
- Retractable up to 75 cm
- Less accessories and lost items, so very economical.
- Easy to be adjusted.
- Safe against high wind load.
- Suitable for straight and curved walls.
- Has 3 Access levels, so work is fast safe and easier.

V.M.C System

VMC is Acrow man handling column system.
It is very suitable where crane is not available.
The flexibility of column cross section -5 cm increments- make it easy to be adjusted without re-assembly.
For safety the system is equipped with concreting platform.

Circular Column System

Circular Column system is easy in erection and adjustment.
The two halves of the column formwork are of the highest manufacturing quality to avoid the need of matching pairs that simplifies daily use.
The release agent coating minimize the concrete adhesion and therefore cleaning costs.
Connecting panels using the Acrow bolts ensures that the connection is flush tight.
Cross section column diameters vary from 250 to 2000 mm.
Special sizes up on request.
Height increments of 500 mm can be achieved using the variable panel heights.

Acrow flex System

The Acrow flex is a slab formwork system that could be adapted to any floor plan.
The beams are supported by props.
It consists mainly of H20 wooden beams that work as main and secondary girders.
Acrow flex is mainly when shoring height is less than 4.5 m.
Acrow flex is the cost effective solution for slabs of thickness up to 50 cm.
Few system components, only H20 girders, Props, stirrup heads and Prop legs.

Acrow Europen Prop AEP

The Prop AEP is designed to be used as a support element for Acrow horizontal formwork.
The AEP is a hot dip galvanized Prop having high durability.
Using the AEP (Acrow European Prop) gives high load capacity.
Permanent preventation against unintentional disengagement.
The inner and outer parts of a prop shall be prevented permanently from being separated except by intentional action.
Anti hand trap. When the prop is fully closed without the pin inserted, there is 100 mm clearance between the endmost part of the outer tube and the inner tube.

Shorbrace Table Form System

Due to high load capacity shorbrace is on of the most economical table system for heavy civil engineering project.
Shorbrace table with prop extension is very flexible so it is one of the best systems for building constructions.
Shorebrace can be connected to each other so Shorebrace table is available for any height.
Vertically adjusting can be done either by post head jack in Shorebrace table for heavy structure or by prop extension.
